

Export Your Thesaurus

To prevent the loss of data and work it is important to back up projects in PoolParty regularly. During the creation of the project PoolParty also offers a [snapshot mechanism](#), but it is still recommended to export projects from time to time. In parallel you might want to re-use the thesauri of your project in other projects.

1. Select **Export** in the **Project** menu. Expand the menu, select **RDF Project Export**.
The **RDF Export Project** dialogue opens.
2. To export the whole project, it is recommended that you activate the check box beside **Export Project**. The other options will then be greyed out.
 - If you want to export only parts of the project, select the data format and the elements you need, for example concepts, workflows or the history.
 - Select the export format (e.g. 'Trig'). Since we have mapped some linked data to our project, we should use the format 'TriX' or 'Trig' for the export.
3. Click **Export**.
4. The browser's default **Save As** dialogue will open so you can choose the location for the file.

Since we have made an export of our work, we finally might want to [delete the project](#) we have created.

The export does not include information on [deleted concepts](#) or [merged concepts](#). Those are only included in [snapshots of the projects](#).
